- Parameter Passing and Common Mistakes

Today

- Getting Started in C++
- Thinking Recursively
- Style Gameshow
- Parameter Passing and Common Mistakes

The `main` Function

- A C++ program begins execution in a function called `main` with the following signature:

```
int main() {  
    /* ... code to execute ... */  
}
```

- By convention, `main` should return 0 unless the program encounters an error.

Getting Input from the User

- In C++, we use `cout` to display text.
- We can also use `cin` to receive input.
- For technical reasons, we've written some functions for you that do input.
 - Take CS106L to see why!
- The library "`simpio.h`" contains methods for reading input:

```
int getInteger(string prompt = "");
```

```
double getReal(string prompt = "");
```

```
string getLine(string prompt = "");
```

Getting Input from the User

- In C++, we use `cout` to display text.
- We can also use `cin` to receive input.
- For technical reasons, we've written some functions for you that do input.
 - Take CS106L to see why!
- The library "`simpio.h`" contains methods for reading input:

```
int getInteger(string prompt = "");  
double getReal(string prompt = "");  
string getLine(string prompt = "");
```

These functions have **default arguments**. If you don't specify a prompt, it will use the empty string.

hello-world.cpp
(On Board)

C++ Functions

- Functions in C++ are similar to methods in Java:
 - Piece of code that performs some task.
 - Can accept parameters.
 - Can return a value.
- Syntax similar to Java:

```
return-type function-name (parameters) {  
    /* ... function body ... */  
}
```

Note: no
public or
private.

abs.cpp
(On Computer)

What Went Wrong?

One-Pass Compilation

- Unlike some languages like Java or C#, C++ has a **one-pass compiler**.
 - Think of it like a person reading a book from start to finish.
- If a function has not yet been declared when you try to use it, you will get a compiler error.

Function Prototypes

- A **function prototype** is a declaration that tells the C++ compiler about an upcoming function.
- Syntax:
return-type function-name (parameters) ;
- A function can be used if the compiler has seen either the function itself or its prototype.

Factorials

- The number **n factorial**, denoted **$n!$** , is

$$n \times (n - 1) \times \dots \times 3 \times 2 \times 1$$

- For example:
 - $3! = 3 \times 2 \times 1 = 6$.
 - $5! = 5 \times 4 \times 3 \times 2 \times 1 = 120$
 - $0! = 1$ (by definition)
- Factorials show up everywhere:
 - Taylor series.
 - Counting ways to shuffle a deck of cards.
 - Determining how quickly computers can sort values (more on that later this quarter).

factorial.cpp
(On Board)

Digital Roots

- The **digital root** of a number can be found as follows:
 - If the number is just one digit, then it's its own digital root.
 - If the number is multiple digits, add up all the digits and repeat.
- For example:
 - 5 has digital root 5.
 - $42 \rightarrow 4 + 2 = 6$, so 42 has digital root 6.

Digital Roots

- The **digital root** of a number can be found as follows:
 - If the number is just one digit, then it's its own digital root.
 - If the number is multiple digits, add up all the digits and repeat.
- For example:
 - 5 has digital root 5.
 - $42 \rightarrow 4 + 2 = 6$, so 42 has digital root 6.
 - $137 \rightarrow 1 + 3 + 7 = 11$
 $11 \rightarrow 1 + 1 = 2$,
so 137 has digital root 2.

Working One Digit at a Time

Today

- Getting Started in C++
- **Thinking Recursively**
- Style Gameshow
- Parameter Passing and Common Mistakes

A **recursive solution** is a solution that is defined in terms of itself.

Recursion: Fibonacci Numbers

- Fibonacci Numbers
 - 0, 1, 1, 2, 3, 5, 8, 13, 21, ...
 - Defined *recursively*:

$$fib(n) = \begin{cases} n & \text{if } n = 0 \text{ or } 1 \\ fib(n-1) + fib(n-2) & \text{otherwise} \end{cases}$$

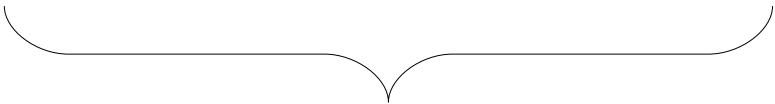

Factorial Revisited

$$5! = 5 \times 4 \times 3 \times 2 \times 1$$

Factorial Revisited

$$5! = 5 \times 4 \times 3 \times 2 \times 1$$

Factorial Revisited

$$5! = 5 \times 4 \times 3 \times 2 \times 1$$

$$4!$$

Factorial Revisited

$$5! = 5 \times 4!$$

Factorial Revisited

$$5! = 5 \times 4!$$

Factorial Revisited

$$5! = 5 \times 4!$$

$$4! = 4 \times 3 \times 2 \times 1$$

Factorial Revisited

$$5! = 5 \times 4!$$

$$4! = 4 \times 3 \times 2 \times 1$$

Factorial Revisited

$$5! = 5 \times 4!$$

$$4! = 4 \times \underbrace{3 \times 2 \times 1}_{3!}$$

Factorial Revisited

$$5! = 5 \times 4!$$

$$4! = 4 \times 3!$$

Factorial Revisited

$$5! = 5 \times 4!$$

$$4! = 4 \times 3!$$

Factorial Revisited

$$5! = 5 \times 4!$$

$$4! = 4 \times 3!$$

$$3! = 3 \times 2 \times 1$$

Factorial Revisited

$$5! = 5 \times 4!$$

$$4! = 4 \times 3!$$

$$3! = 3 \times 2 \times 1$$

Factorial Revisited

$$5! = 5 \times 4!$$

$$4! = 4 \times 3!$$

$$3! = 3 \times 2 \times 1$$

$2!$

Factorial Revisited

$$5! = 5 \times 4!$$

$$4! = 4 \times 3!$$

$$3! = 3 \times 2!$$

Factorial Revisited

$$5! = 5 \times 4!$$

$$4! = 4 \times 3!$$

$$3! = 3 \times 2!$$

Factorial Revisited

$$5! = 5 \times 4!$$

$$4! = 4 \times 3!$$

$$3! = 3 \times 2!$$

$$2! = 2 \times 1!$$

Factorial Revisited

$$5! = 5 \times 4!$$

$$4! = 4 \times 3!$$

$$3! = 3 \times 2!$$

$$2! = 2 \times 1!$$

$$1! = 1 \times 0!$$

Factorial Revisited

$$5! = 5 \times 4!$$

$$4! = 4 \times 3!$$

$$3! = 3 \times 2!$$

$$2! = 2 \times 1!$$

$$1! = 1 \times 0!$$

$$0! = 1$$

factorial.cpp
(On Computer)

Another View of Factorials

$$n! = \begin{cases} 1 & \text{if } n = 0 \\ n \times (n - 1)! & \text{otherwise} \end{cases}$$

```
int factorial(int n) {  
    if (n == 0) {  
        return 1;  
    } else {  
        return n * factorial(n - 1);  
    }  
}
```

Another View of Factorials

$$n! = \begin{cases} 1 & \text{if } n = 0 \\ n \times (n - 1)! & \text{otherwise} \end{cases}$$

```
int factorial(int n) {  
    if (n == 0) {  
        return 1;  
    } else {  
        return n * factorial(n - 1);  
    }  
}
```

Recursion in Action

```
int main() {  
    int n = factorial(5);  
    cout << "5! = " << n << endl;  
}
```

Recursion in Action

```
int main() {  
    int n = factorial(5);  
    cout << "5! = " << n << endl;  
}
```

Recursion in Action

```
int main() {  
    int factorial(int n) {  
        if (n == 0) {  
            return 1;  
        } else {  
            return n * factorial(n - 1);  
        }  
    }  
    int n 5
```

Recursion in Action

```
int main() {  
    int factorial(int n) {  
        if (n == 0) {  
            return 1;  
        } else {  
            return n * factorial(n - 1);  
        }  
    }  
}
```

`int n` 5

Recursion in Action

```
int main() {  
    int factorial(int n) {  
        if (n == 0) {  
            return 1;  
        } else {  
            return n * factorial(n - 1);  
        }  
    }  
}
```

`int n` 5

Recursion in Action

```
int main() {  
    int factorial(int n) {  
        if (n == 0) {  
            return 1;  
        } else {  
            return n * factorial(n - 1);  
        }  
    }  
}
```

`int n` 5

Recursion in Action

```
int main() {  
    int factorial(int n) {  
        int factorial(int n) {  
            if (n == 0) {  
                return 1;  
            } else {  
                return n * factorial(n - 1);  
            }  
        }  
    }  
}
```

`int n` 4

Recursion in Action

```
int main() {  
    int factorial(int n) {  
        int factorial(int n) {  
            if (n == 0) {  
                return 1;  
            } else {  
                return n * factorial(n - 1);  
            }  
        }  
    }  
}
```

int n 4

Recursion in Action

```

            }  
        }  
    }  
}
```

Diagram illustrating recursive calls for factorial(1). The code is shown with nested boxes representing function calls. A yellow box with '1' is connected by a line to the `return n * factorial(n - 1);` line in the innermost call. A blue box with '1' is next to the `int n` declaration in the same call.

Recursion in Action

```
int main() {  
    int factorial(int n) {  
        int factorial(int n) {  
            int factorial(int n) {  
                int factorial(int n) {  
                    if (n == 0) {  
                        return 1;  
                    } else {  
                        return n * factorial(n - 1);  
                    }  
                }  
            }  
        }  
    }  
}
```

int n **2**

Recursion in Action

```
int main() {  
    int factorial(int n) {  
        int factorial(int n) {  
            int factorial(int n) {  
                int factorial(int n) {  
                    if (n == 0) {  
                        return 1;  
                    } else {  
                        return n * factorial(n - 1);  
                    }  
                }  
            }  
        }  
    }  
}
```

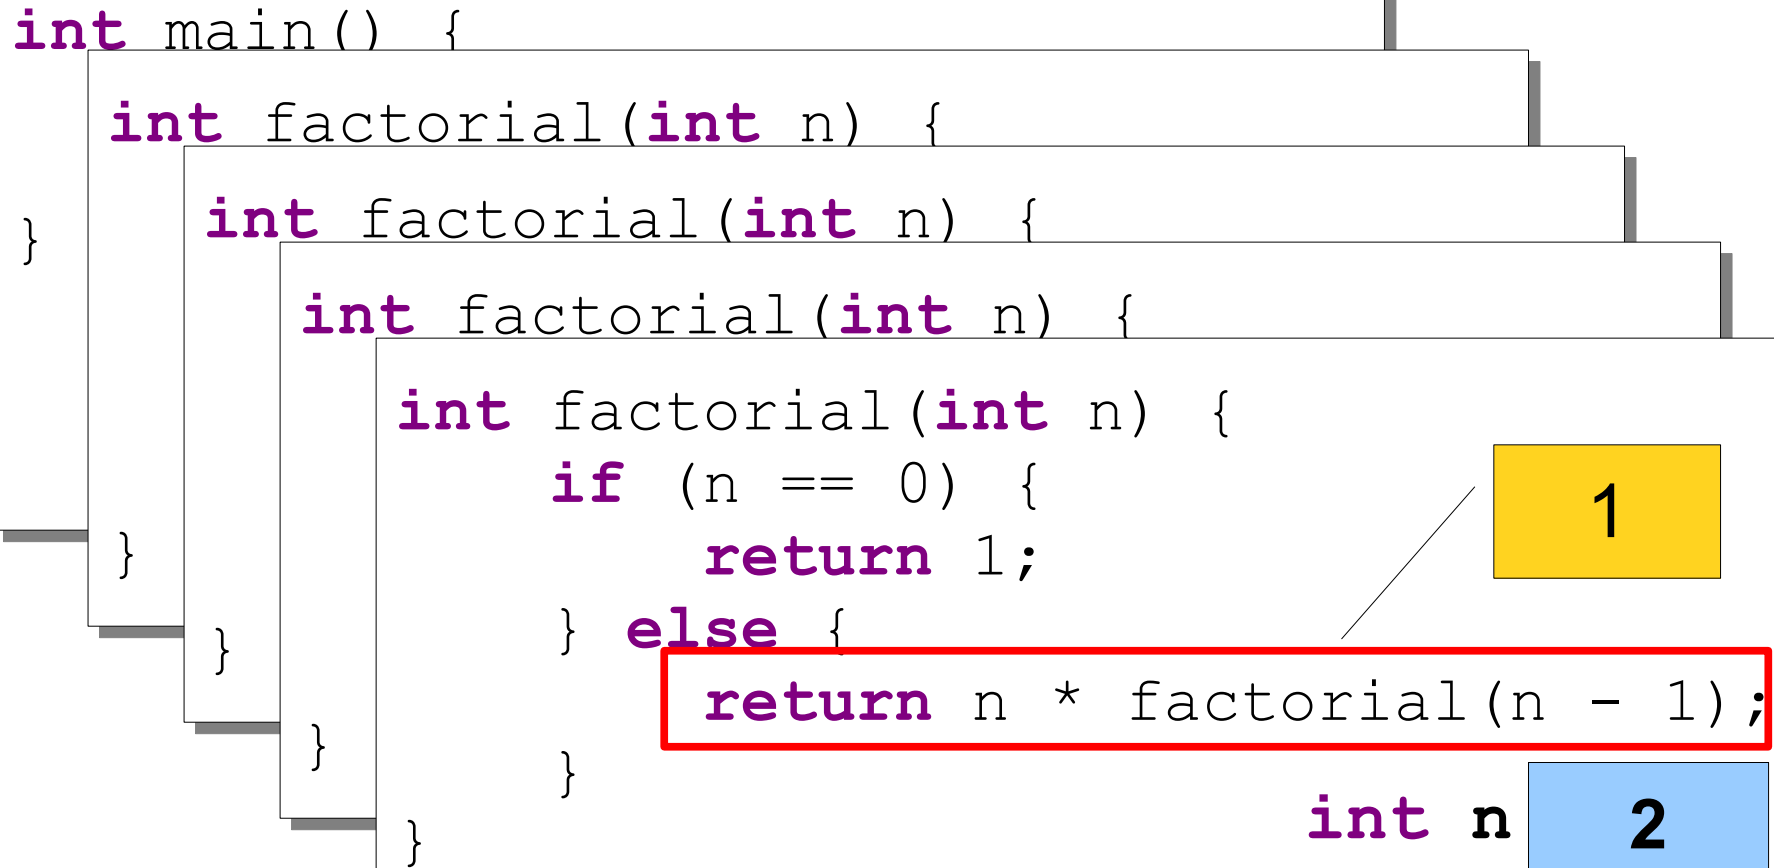

Diagram illustrating recursive calls for factorial(2). The code is shown with nested boxes representing function calls. A yellow box with the number 1 is connected by a line to the `return n * factorial(n - 1);` line in the innermost function call. A blue box with the number 2 is positioned next to the `int n` parameter of the same innermost function call.

Recursion in Action

```
int main() {  
    int factorial(int n) {  
        int factorial(int n) {  
            int factorial(int n) {  
                if (n == 0) {  
                    return 1;  
                } else {  
                    return n * factorial(n - 1);  
                }  
            }  
        }  
    }  
}
```

int n **3**

Recursion in Action

```
int main() {  
    int factorial(int n) {  
        int factorial(int n) {  
            int factorial(int n) {  
                if (n == 0) {  
                    return 1;  
                } else {  
                    return n * factorial(n - 1);  
                }  
            }  
        }  
    }  
}
```

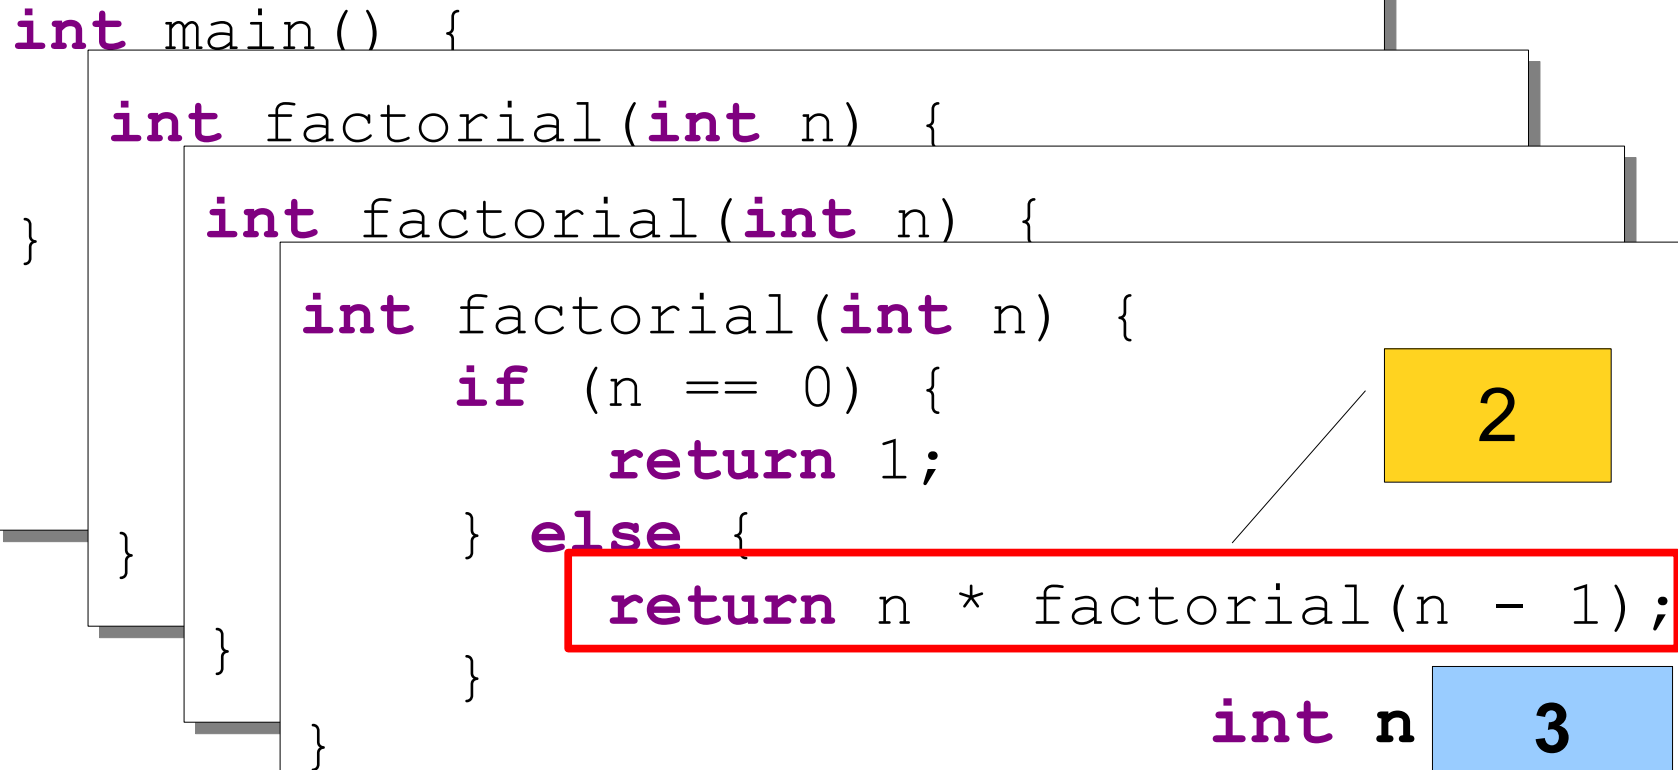

Diagram illustrating recursive calls for factorial(3). The code is shown in four nested frames. A yellow box with the number 2 is connected by a line to the `return n * factorial(n - 1);` line in the third frame. A blue box with the number 3 is next to the `int n` declaration in the bottom-most frame.

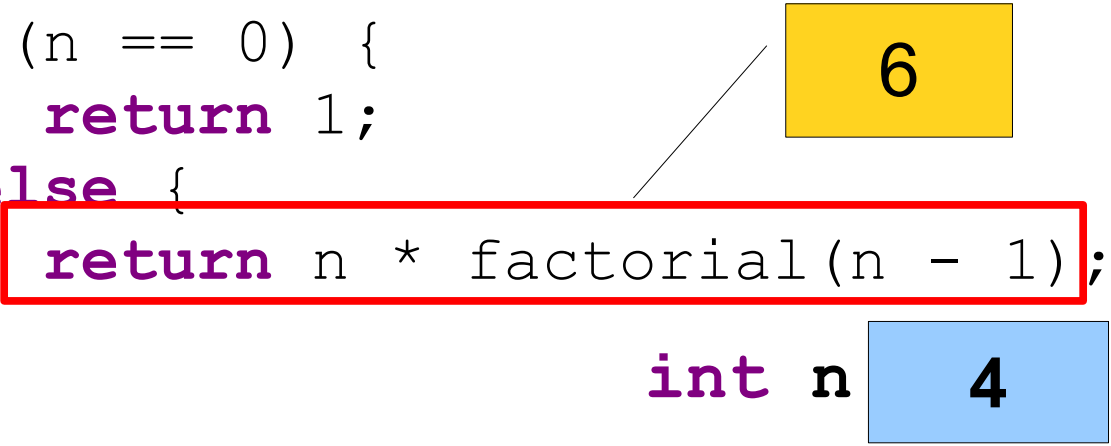

Recursion in Action

```
int main() {  
    int factorial(int n) {  
        int factorial(int n) {  
            if (n == 0) {  
                return 1;  
            } else {  
                return n * factorial(n - 1);  
            }  
        }  
    }  
}
```

`int n` 4

Recursion in Action

```
int main() {  
    int factorial(int n) {  
        int factorial(int n) {  
            if (n == 0) {  
                return 1;  
            } else {  
                return n * factorial(n - 1);  
            }  
        }  
    }  
}
```

The diagram illustrates the recursive calculation of factorial(4). A yellow box containing the number 6 is connected by a line to the recursive call `factorial(n - 1)` in the code. A blue box containing the number 4 is positioned next to the variable `n` in the same line of code, indicating the current value of `n` during this recursive step.

Recursion in Action

```
int main() {  
    int factorial(int n) {  
        if (n == 0) {  
            return 1;  
        } else {  
            return n * factorial(n - 1);  
        }  
    }  
}
```

`int n` 5

Recursion in Action

```
int main() {  
    int factorial(int n) {  
        if (n == 0) {  
            return 1;  
        } else {  
            return n * factorial(n - 1);  
        }  
    }  
}
```

The diagram illustrates a recursive call in a factorial function. A yellow box containing the number 24 is connected by a line to the recursive call `factorial(n - 1)` in the code. A blue box containing the number 5 is next to the variable `n` in the function signature, indicating the current value of `n` is 5.

Recursion in Action

```
int main() {  
    int n = factorial(5);  
    cout << "5! = " << n << endl;  
}
```

Recursion in Action

```
int main() {  
    int n = factorial(5);  
    cout << "5! = " << n << endl;  
}
```

int n 120

Recursion in Action

```
int main() {  
    int n = factorial(5);  
    cout << "5! = " << n << endl;  
}
```

int n 120

Thinking Recursively

- Solving a problem with recursion requires two steps.
- First, determine how to solve the problem for simple cases.
 - This is called the **base case**.
- Second, determine how to break down larger cases into smaller instances.
 - This is called the **recursive decomposition**.

Another View of Factorials

$$n! = \begin{cases} 1 & \text{if } n = 0 \\ n \times (n - 1)! & \text{otherwise} \end{cases}$$

Base Case

Recursive Decomposition

Thinking Recursively

if (*problem is sufficiently simple*) {

Directly solve the problem.

Return the solution.

} **else** {

*Split the problem up into one or more smaller
problems with the same structure as the original.*

Solve each of those smaller problems.

Combine the results to get the overall solution.

Return the overall solution.

}

Summing Up Digits

- One way to compute the sum of the digits of a number is shown here:

```
int sumOfDigits(int n) {  
    int result = 0;  
    while (n != 0) {  
        result += n % 10;  
        n /= 10;  
    }  
    return result;  
}
```

- How would we rewrite this function recursively?

Summing Up Digits

The sum of these digits of
this number...

is equal to the sum of the
digits of this number...

Summing Up Digits

The sum of these digits of
this number...

is equal to the sum of the
digits of this number...

plus this number.

digital-roots.cpp
(On Computer)

Summing Up Digits

- A recursive implementation of `sumOfDigits` is shown here:

```
int sumOfDigits(int n) {  
    if (n < 10) {  
        return n;  
    } else {  
        return (n % 10) + sumOfDigits(n / 10);  
    }  
}
```

- Notice the structure:
 - If the problem is simple, solve it directly.
 - Otherwise, reduce it to a smaller instance and solve that one.

Computing Digital Roots

- One way of computing a digital root is shown here:

```
int digitalRoot(int n) {  
    while (n >= 10) {  
        n = sumOfDigits(n);  
    }  
    return n;  
}
```

- How might we rewrite this function recursively?

Digital Roots

Digital Roots

The digital root of **9 2 5 8**

Digital Roots

The digital root of **9 2 5 8** is the same as

Digital Roots

The digital root of **9 2 5 8** is the same as

The digital root of **$9+2+5+8$**

Digital Roots

The digital root of **9 2 5 8** is the same as

The digital root of **2 4**

Digital Roots

The digital root of **9 2 5 8** is the same as

The digital root of **2 4** which is the same as

Digital Roots

The digital root of **9 2 5 8** is the same as

The digital root of **2 4** which is the same as

The digital root of **2 + 4**

Digital Roots

The digital root of 9 2 5 8 is the same as

The digital root of 2 4 which is the same as

The digital root of 6

Computing Digital Roots

- Here is one recursive solution:

```
int digitalRoot(int n) {  
    if (n < 10) {  
        return n;  
    } else {  
        return digitalRoot(sumOfDigits(n));  
    }  
}
```

- Again, notice the structure:
 - If the problem is simple, solve it directly.
 - If not, solve a smaller version of the same problem.

Recursion vs. Iteration

- Any problem solved using *iteration* (for/while loops) can be solved using *recursion*
- All the recursive solutions we've covered today can be solved equally well using iteration
 - This is to help us feel more comfortable with recursion
 - When the choice is available, iteration is preferred to recursion
- Soon we'll start covering problems that can only be solved using recursion

Today

- Getting Started in C++
- Thinking Recursively
- **Style Gameshow**
- Parameter Passing and Common Mistakes

Style Gameshow

- Style is a very important part of programming.
 - In the real world, other people need to be able to read your code!
- Guess what I don't like about the style of the code and get a prize!

Bad Style #1

```
int spork(int x, int y) {  
    int p = Mumbo(y);  
  
    int pp = Jumbo(x);  
  
    if (p*pp > 0) {  
        return Jabba(p);  
    }  
  
    return Jabba(pp);  
}
```

Bad Style #1

```
int spork(int x, int y) {  
    int p = Mumbo(y);  
    int pp = Jumbo(x);  
    if (p*pp > 0) {  
        return Jabba(p);  
    }  
    return Jabba(pp);  
}
```

I have no clue what is going on in this function!!!

Good Style #1

```
int calculateAreaOfRectangle(int width, int height) {  
    return width*height  
}
```

Bad Style #2

```
void printPrimeNumbers() {  
    for (int i = 0; i < 20; i++) {  
        if (isPrime(i)) {  
            cout << i << endl;  
        }  
    }  
}
```

Bad Style #2

```
void printPrimeNumbers() {  
    for (int i = 0; i < 20; i++) {  
        if (isPrime(i)) {  
            cout << i << endl;  
        }  
    }  
}
```

Magic Number!

Better Style #2

```
const int kMaxPrime = 20;

int main() {
    printPrimeNumbers();
}

void printPrimeNumbers() {
    for (int i = 0; i < kMaxPrime; i++) {
        if (isPrime(i)) {
            cout << i << endl;
        }
    }
}
```

Best Style #2

```
const int kMaxPrime = 20;

int main() {
    printPrimeNumbers(kMaxPrime);
}

void printPrimeNumbers(int maxPrime) {
    for (int i = 0; i < maxPrime; i++) {
        if (isPrime(i)) {
            cout << i << endl;
        }
    }
}
```

Bad Style #3

```
if (isWord == true) {  
    return true;  
} else {  
    return false;  
}
```

Bad Style #3

```
if (isWord == true) {  
    return true;  
} else {  
    return false;  
}
```

Redundant boolean check

Better Style #3

```
if (isWord) {  
    return true;  
} else {  
    return false;  
}
```

Best Style #3

```
if (isWord) {  
    return true;  
} else {  
    return false;  
}  
  
return isWord;
```

Bad Style #4

```
const int kSumMax = 10;

int sum;

int main() {
    sum = 0;
    for (int i = 0; i < kSumMax; i++) {
        sum += i;
    }
    cout << "Sum:" << sum;
    return 0;
}
```
